

HEINE BETA200 LED RETINOSCOPE

For easy and quick observation of the fundus reflex

Manual retinoscopy is the most accurate examination for the objective assessment of vision problems. Compared with autorefraction, it has the crucial advantage that it can also be used on children with attention deficit disorders or patients with a poor ability to cooperate.

Now with LED in HQ

For a very bright, readily visible fundus reflex: brilliant, precise streak image with a line width of typically 1.1 mm (ISO 12865 Standard < 1.5 mm) and a line length of 35 mm. Completely homogeneous and bright light for a precise, fast diagnosis. LED working life typ. 50,000 hours.

Adjustable feel-good lighting for the patient: exclusive continuous brightness control between 100 % and 3 % (patented) with one-finger operation for glare-free light.

Polarisation filter: Eliminates stray light and internal reflexes

ParaStop for the precise selection of the parallel beam
